VELTARO

VELTARO LABS Preliminary Mobility Feasibility Research Brief; V1 remains long-term dual-architecture R&D

Concept-stage founder review · 13 November 2026

Problem

Mobility innovation teams, early engineering teams and research project managers may face costly uncertainty in early technology decisions, fragmented technical literature and architecture assumptions. Confirm whether this problem warrants an external desk brief.

Solution

VELTARO LABS Preliminary Mobility Feasibility Research Brief; V1 remains long-term dual-architecture R&D. Software prototypes demonstrate workflow only. No physical-product, regulated engineering or operational permission claim.

Product portfolio

LABS first prospective commercial workstream. V1 flagship research; AIR aviation, SKYCOURIER aerial logistics and GROUND delivery/mobility remain concepts. Separate each mission and risk boundary.

Market and customers

Use the dated source register below. Official EASA and EU frameworks show distinct road and aircraft approval questions. Public competitor pages establish research categories, not validated V1 demand. TAM/SAM/SOM: TBD. Obtain segment counts, procurement budgets, interview records and bottom-up reachable account estimates before quoting market size. Mobility innovation teams, early engineering teams and research project managers

Technology and progress

LABS gate: reproducible sample, evidence review and scope competence. V1 gate: common lawful mission and comparable uncertainty inputs for VTOL and folding fixed wing. Both remain HOLD. Close pack-level mass, usable energy, peak power/thermal constraints, conversion hazards and infrastructure permissions before any architecture selection. Software arithmetic cannot authorize flights or establish airworthiness.

Alternatives and differentiation

Joby is an aviation landscape example; PAL-V illustrates a different road/air concept. Neither validates V1 economics or certification. LABS alternatives include internal engineering staff, university research/transfer groups such as DLR and established specialist consultancies. This is a preliminary landscape, not an exhaustive competitive or pricing study. Compare competence, evidence review, scope and turnaround using actual quotations before positioning against them.

Business model hypothesis

Test a fixed-scope LABS desk brief first. Intake → competency/conflict screening → scope/contract → public-source research → evidence and uncertainty register → qualified review → export → customer acceptance. Price by bounded effort only after interviews and legal trading review. V1/AIR/SKYCOURIER/GROUND consume research capital; no vehicle revenue is included in the planning base case.

Validation evidence

Existing repository checks pass at baseline. Local software and browser tests are recorded separately in evidence/. No customer, physical product or commercial readiness claim.

Development roadmap

M1 (0–30 days target): reproduce repository tests and review scope. M2 (31–60): complete missing engineering integrations or bounded LABS delivery rehearsal. M3 (61–90): independently review evidence, costs and discovery findings. M4: founder decides continuation using measured gate evidence. These windows are planning targets, not delivery promises. See READINESS.md for actual status.

Financial scenarios

36-month editable workbook. Base revenue hypothesis is zero. Low/base/high cost assumptions are unquoted and unverified. Funding must be scoped to a reviewed gate. No investment commitment or valuation is claimed.

Risks and external gates

Principal risks: no demonstrated buyer need, insufficient qualified delivery capacity, inaccurate technical assumptions, privacy and image rights, unclear IP ownership, legal trading ability and capital shortfall. Road/air conversion, loss of lift, energy thermal limits, certification uncertainty and infrastructure access require qualified review.

Funding strategy

Use financial-model.xlsx to estimate a gate-bounded cash requirement. No actual investment ask or valuation is justified yet. Obtain written engineering, hardware, legal and insurance quotes; confirm hiring capacity and taxes. EIC Accelerator is a public research lead only; eligibility, live call deadlines, legal status and co-financing remain unverified.

Founder review decision

Approve the next bounded evidence gate, qualified review roles and source-based budget. Do not approve public promotion or commercial launch until release gates close.
